

# *Maverick* IP Sub Metering Appliance

## Lowest Cost Energy Metering Solution

The *Maverick* IP Sub Metering Appliance incorporates a web server, accepts a pulse input from any energy meter (KWH, BTU, water, gas, steam or air) and displays consumption by the minute, hour, day, week, month and year. The *Maverick* logs the data in CSV format and usage can be viewed as bar graphs. Consumption reports for each period can be emailed and imported into Excel, Word or any other application which accepts CSV files. Data is available formatted for XML and any application can parse the values for storage or analysis. Email/SMS alerts can be sent out if the minute, hour, day,

week, month or year consumption exceeds a programmed threshold for demand response. No additional software is required to provide the above functionality. All you need is a web browser running on any PC, laptop or smart phone anywhere in the world.

The *Maverick* Browser, a PC-based freeware utility, can be downloaded to congregate and display on one page multiple Sub Meters located in the facility or worldwide. Numerous third party web-hosted or PC-based Dashboards have been developed to provide customized energy reports. BACnet, OPC, SNMP and Modbus gateways are available to integrate the *Maverick* Sub Meters into any existing installation.
